About Loading Corporate List Price in USD Currency

The suppliers with hosted catalog need to create a content submission to edit content in their hosted catalog and a price submission to edit pricing for products in the hosted catalog. One exception is that the Corporate List price in USD currency can be included in a content submission. However, note that this functionality is expected to be used only by Science Catalog suppliers. Such suppliers load a single Corporate List price in USD currency for all of their customers. This functionality allows them to edit content as well as the single price set that they have, using a single content submission.

If you have a hosted enablement for your catalog with one or more customer(s), you need to use a price submission to load pricing for the customer(s). In such a case, even if technically you can include Corporate List price in USD currency with your content, please load it via a price file. You should use a price submission to load Corporate List price in USD

currency by itself or with any other pricing – private pricing for the customer(s) in any currency and List price in any currency.

If you have any questions about this topic, please contact:
Dr. Subodh Joshi at (919) 659-2223 or sjoshi@jaggaer.com

Specifying Currency for a Hosted Price Set

When using an Excel file for price submission, it is important to use 'general' or 'text' formatting for price set columns to avoid unexpected results. Here are the details.

When a price set is provided in a price file to edit List Price, Private Price or Contract Price via a price submission, it is expected to have headers that indicate price set name and currency. The currency is indicated by using appropriate three-letter currency code, such as USD, GBP, CAD, EUR etc. With our 18.1 Product Release, which became effective on 8th April 2018, an Excel file can be used to create such a price submission. In an Excel file a value can be formatted as a 'currency'. Such value is displayed with a currency symbol and commas as a thousands separator. However, this can cause issues and a value should NOT be formatted in this way.

- The data loading tool considers only the currency indicated in the header. If it is not included, USD currency or the customer's base currency is used for the values. As a result, when values are formatted as currency in Excel with currency that is different than the currency code in header or when currency code in the header is missing, the values will get loaded with incorrect currency
- Even if the currency code in header matches the currency used in Excel format are same, the thousands separator can cause issues if it does not match what has been configured for data loading for your catalog

Hence, if you are using Excel file to create price submission, be sure that all price set columns are formatted as 'general' or 'text'.

Second Evaluation of Data Completeness for 2018

JAGGAER evaluates content of a hosted catalog to identify any data gaps three times a year. The second such scheduled evaluation will be performed on all hosted catalogs using data as of 26th May. Please review the content and make any edits if needed so that you can get the evaluation performed on latest dataset. The results of the evaluation are made available to customers who like to review them when deciding about enablements for their suppliers.

The Data Completeness Reports (DCRs) that provide results of the evaluation will be made available in the July issue of the SupplierNews.
