

Workato for Integration & Automation

Launch integrations 3x faster with pre-built connections

Business Challenge

Organizations typically have data stored in disparate and unconnected applications, so-called “data silos”. This causes inefficiencies as employees spend time searching for, accessing and reconciling data from different sources, and then further duplicate efforts re-entering data and context-switching across applications to accomplish tasks.

“(Workato’s) platform allows non-technical workers to build automations and integrations themselves. This truly empowers organizations to connect systems and data to fit their needs and automate recurring processes at scale.”

Jessica Barry
Senior Business Systems Analyst,
People Systems & Analytics,
Slack Technologies, Inc.

Integration Solution Considerations

Solving this challenge involves more than just transporting single data objects across applications. Integration requires multi-step processes with business logic, workflow capabilities, one-to-many or many-to-one data mappings, and more.

Issues with Integration Solutions Today:

- Integration projects can take a long time, often several months, to implement, while new applications are being added faster than ever, adding complexity
- Integration platform products are relatively high cost, often costing more than the applications being connected
- IT lacks visibility into the integration processes and is unable to collaborate with business users to create and manage integration solutions

Solution: Integration Recipes

The JAGGAER & Workato collaboration addresses these issues with preconfigured integration “recipes” that accelerate time-to-value without the need for significant time and effort by IT specialists.

The Workato platform has a powerful feature set to handle real-world problems, including the integration of applications, data, and people.

Key Features

	Low-code interface Drag-and-drop UI		Autonomous Ops Automated monitoring, Ops
	Reusable recipes Curated and private communities		Implementation End-to-end launch support
	Smart connectors 1,000+ pre-built		User management Collaboration, roles, SSO
	Platform API Recipe, connections, accounts, etc.		Account management Ops, promotion, audit
	Unlimited scaling Cloud-native architecture		

Benefits

- Accelerate time to value with implementations
- Reduce integration development and operation costs
- Extensive control, security, and monitoring
- Easily integrate with any other app
- Gain quicker access to accurate, relevant and consistent data
