# Research Material Management: Stockroom Module

## Save Time and Money by Shopping from Your Own Supplies

In many Stockroom Solutions, all stockrooms are treated the same. In real life, a supply closet, a solvent bunker, a freezer program, and an on-site warehouse provide different services and require different capabilities for management and restocking.

JAGGAER's Research Material Management solution was designed to offer different stockroom profiles that allow organizations to construct their internal research supply chain to meet their needs. Our Stockroom module enables the efficient and effective management of bulk materials, chemicals, lab equipment and other supplies in one or more stockrooms, including chemical items previously registered with the solution.

Researchers performing a search for materials will find stockroom items as an alternative to making an external purchase. Making stock items visible in search results reduces time and effort spent searching for items, improves stockroom utilization, and avoids the cost and time used buying materials when there is existing inventory available right now.

## Improve Visibility Into Safety & Compliance Data

Fire code and safety regulations require organizations to report the total quantity, or keep inventories below threshold limits, for certain listed chemicals. Some of those chemicals, for example nitric acid, are often maintained in significant quantities in stockrooms. By linking stock items with Research Material Management material profiles, you can consolidate reporting of regulated material quantities across both stockrooms and research labs/inventories.

When the Department of Homeland Security requires monitoring access to its regulated materials, Research Material Management unifies reporting of acquisition and consumption required by the DHS across your research labs and stockroom inventory. JAGGAER also offers the option of seamlessly tracking bottles from the stockroom, to the lab, and through disposal for regulated stock items that will not be consumed quickly. Also by linking stock items to a Research Material Management material profile, any safety information associated with that profile,

including MSDS links or codes of practice, are seamlessly available to stockroom personnel.

## Multi-Primary Data Support

Organizations using multiple VMI suppliers face tough operational challenges due to all of the separate vendor systems. Research Material Management's multi-primary data capability provides each VMI supplier with their own environment to manage their operations, items, and pricing, while offering critical integrated capabilities to their shared client – for example:
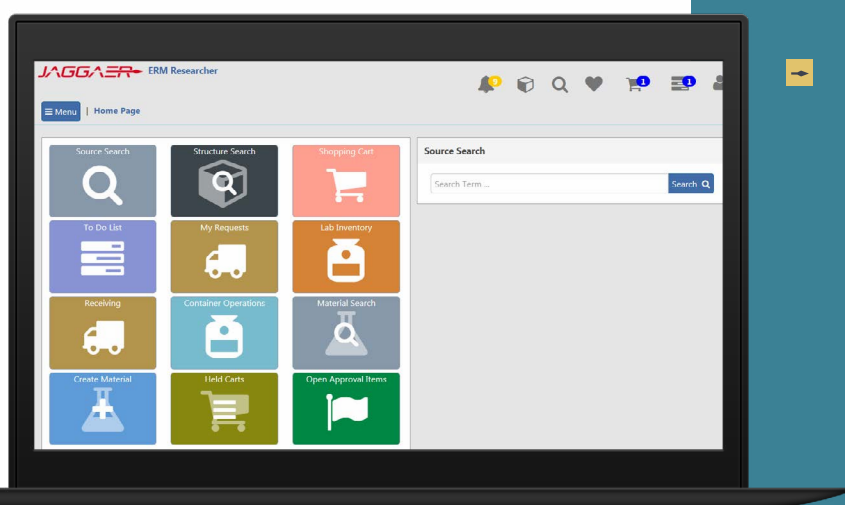

- A unified view of available stock items for researchers
- Streamlined self-serve checkout of products from different vendors from a single kiosk
- The opportunity for a harmonized replenishment purchasing process across suppliers
- Unified usage and replenishment transaction reporting by charge code
- Automated and up-to-date unified EHS reporting of on-site quantities of regulated materials

## Streamline the Replenishment Process

The Research Material Management Stockroom Module leverages integration with your purchasing system to automate the workflow for stockroom replenishment requests. Stock items can be created from or linked to JAGGAER hosted catalog items. A scheduled job will automatically update supplier prices for stock items and report any issues or situations where it appears the associated catalog item has changed significantly.

## Enhanced Capabilities

- Multi-primary data support for different stockroom organizations within the same installation.
- Stock primary item images including automated image capture from JAGGAER Hosted Catalogs
- Support for "hub-and-spoke" restocking of child stockrooms from parent stockrooms.
- Integration with material and hazard profiles without the need to track bar coded containers in stockrooms.
- Simplified use of existing manufacturer labeling for stock items.
